Continuous Ammonia Monitoring for Agriculture (CAMAG)

Case study of a recent STFC Food Network
Plus (SFN+) seed-corn project

Ammonia in the Atmosphere

- Ammonia (NH_3) is an air pollutant, mainly from agriculture (88%) and traffic emissions
- It's an irritant, that is detrimental to human health
- It's the only pollutant not to decrease since 1970!

Current Detection Methods

- Wind tunnels and shuttles
- Accurate and reliable, but slow to read out (~ hours)
- A continuous, real-time method would be welcome

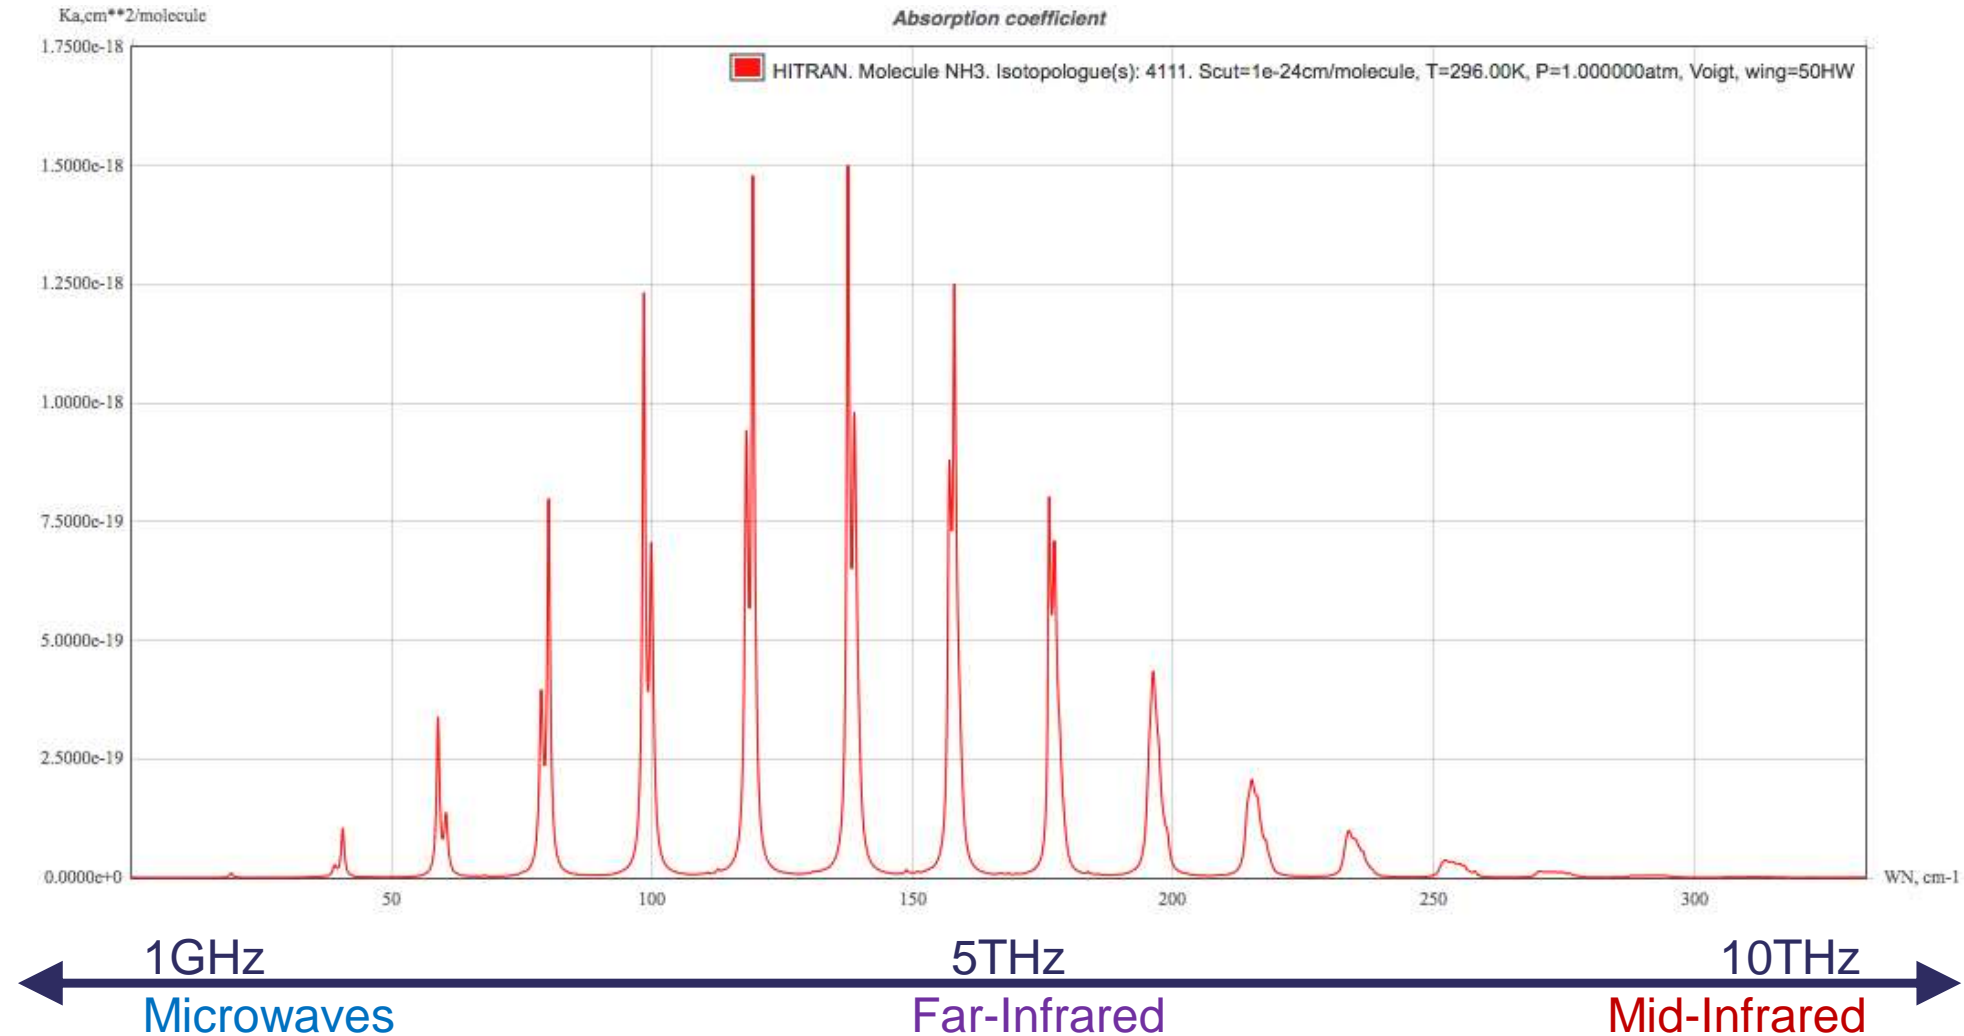

Trace gas remote sensing in astronomy and Earth Observation (EO)

- “*Wiggling*” molecules emit radio signals at characteristic frequencies
- A receiver can pick that signal up, and calculate how much gas there is

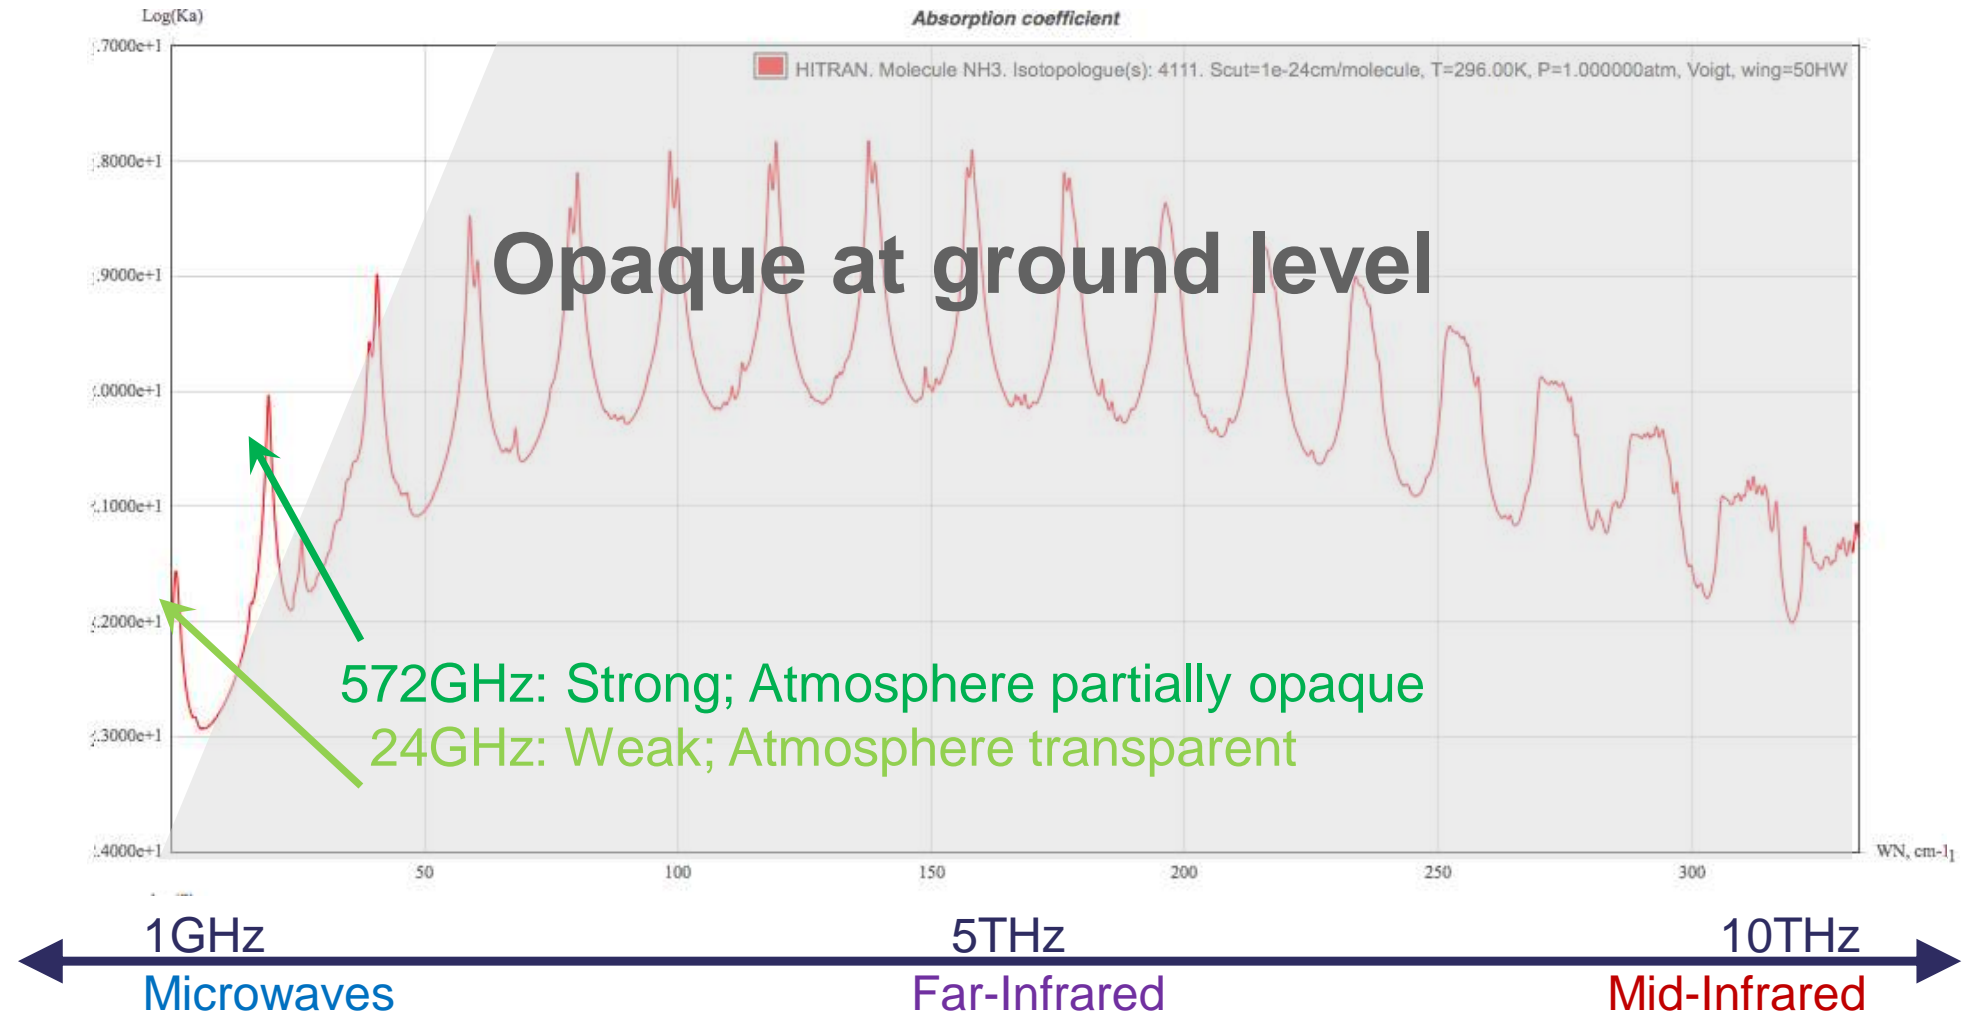

Location of Ammonia Spectral Lines

Atmospheric Transmissivity

Viable Ammonia Spectral Lines

Detectability Analysis for Various Emissions and Atmospheric Scenarios

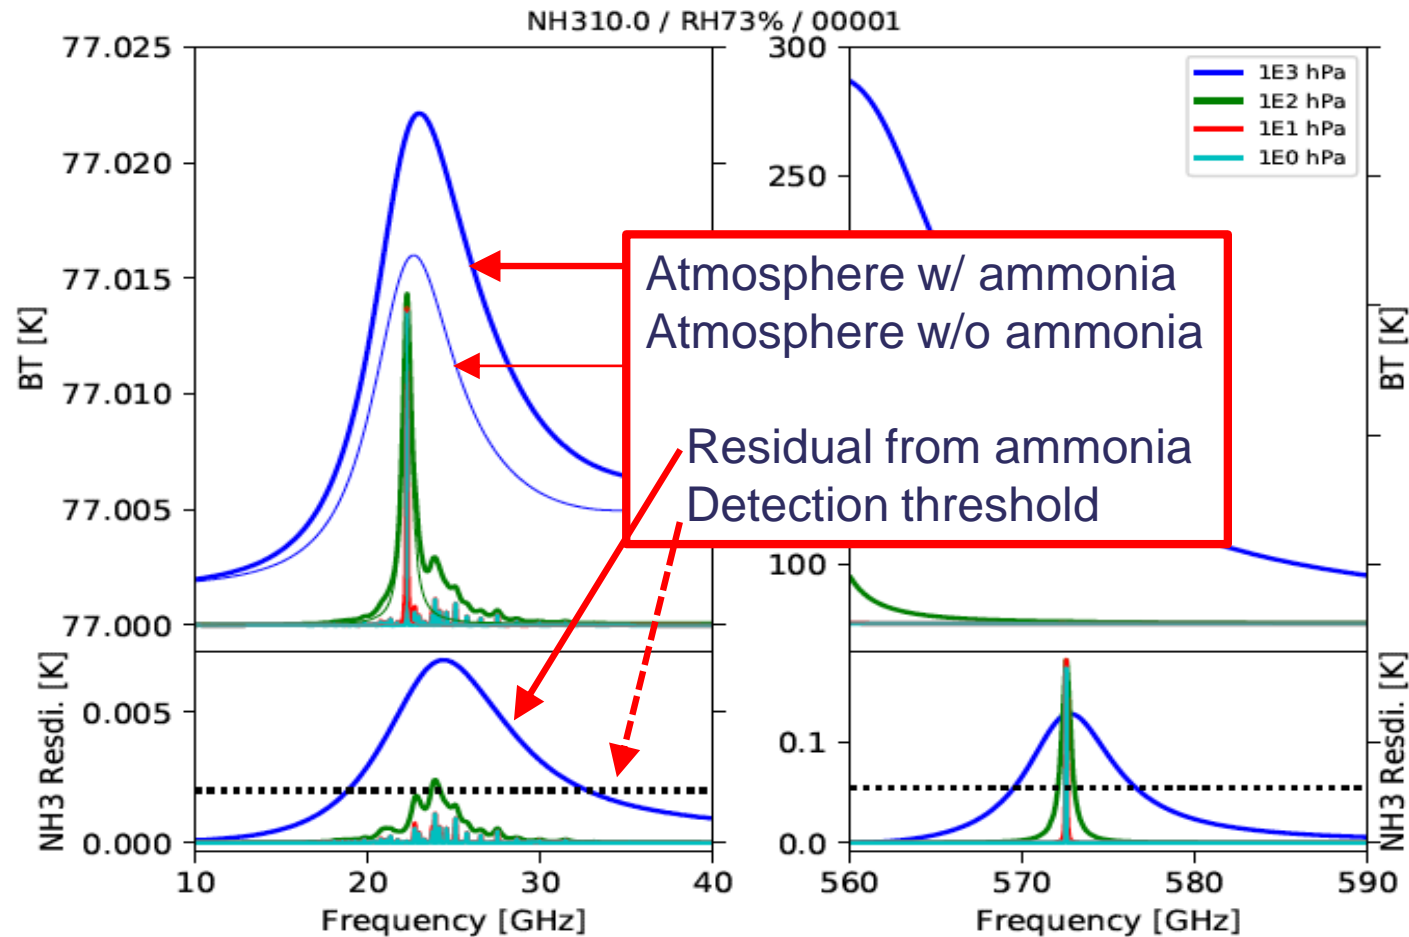

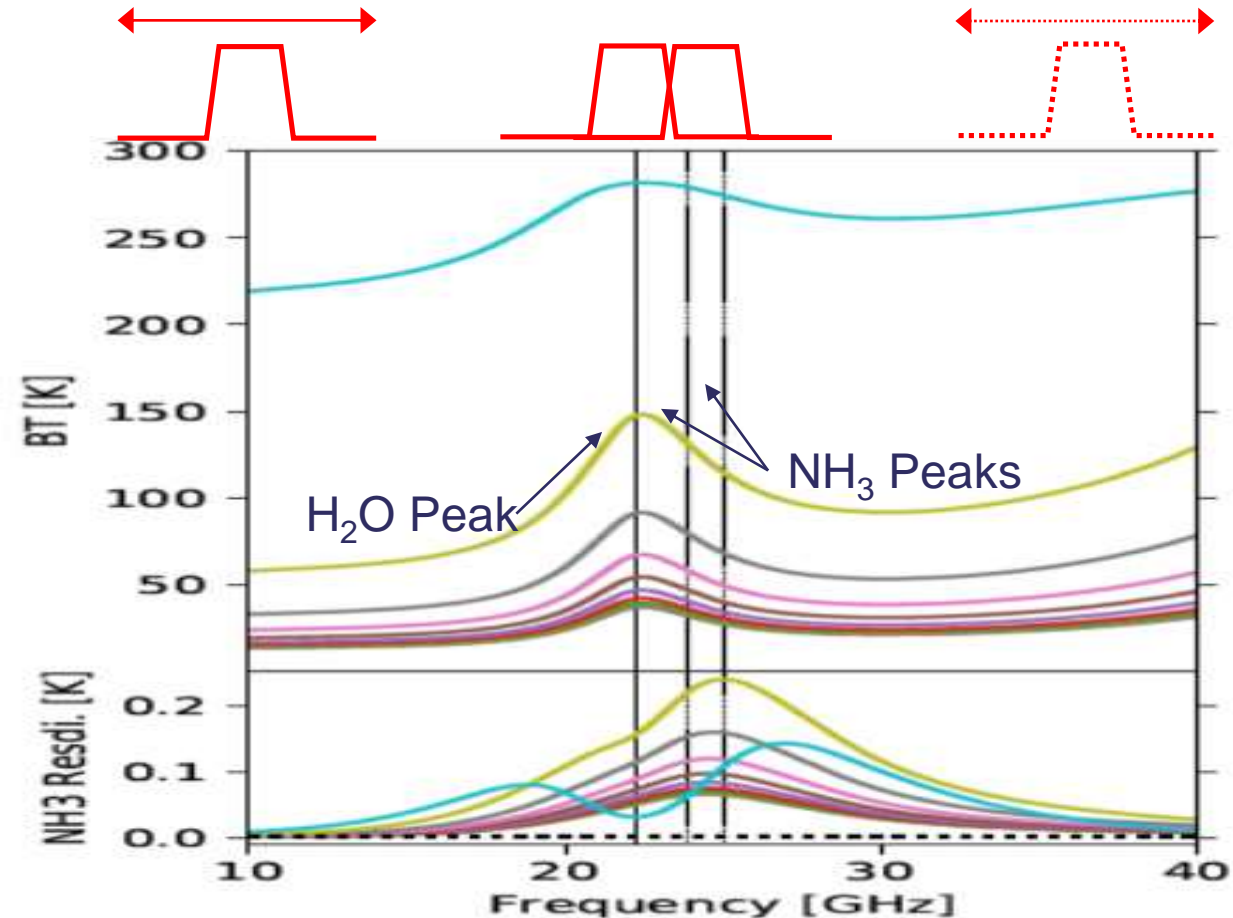

TABLE 2: LIST OF VARIOUS THRESHOLD DETECTION LEVELS [TIMMER,2004] [BECKER,1999]

Detection Limit	Source / Objective
1 ppb	Environmental air monitoring
50 ppb	Breath monitoring
1 ppm	Measuring in stables
10 ppm	Extensive farming / Normal traffic emissions
20 ppm	Chemical alarm: Maximum allowed workspace level
50 ppm	Chemical alarm: Smell detection limit / Severe traffic emissions
500 ppm	Chemical alarm: Immediate and serious irritation of nose and throat
1000 ppm	Chemical alarm: Pulmonary oedema
5,000 ppm - 10,000 ppm	Chemical alarm: Lethal dose (5-10 mins)

Differential Emission Technique

- Three channels should suffice to tell apart NH_3 and H_2O by their differential ratios
 - One 2 GHz channel centered over H_2O
 - One 2 GHz channel centered over NH_3
 - One (or two) channels on the line wing (window channel)
- Cheap and simple!

Ammonia spectra with 2GHz box-car ILS (75% RH, 100m, 1000hPa, 290K)

Open Path Observing Systems

- Concentrated NH_3 levels are found in closed spaces (animal houses) and immediate above fertilized fields
- Beam switching to
 - Maximise the $\text{NH}_3/\text{H}_2\text{O}$ ratio (by removing H_2O only layers)
 - Get a cold background
 - Have a known humidity

Instrument Concept

WR42 Horn
Antenna
RF range:
15-30GHz

LNA 1
Gain: 37dB
NF: 120

LNA 2
Gain: 37dB
NF: 120

Power
Divider
S11: 1dB

Band
Pass
Filters
BW:
2GHz

Video
detectors

ADC
12-bit /
Analogue
Inputs

Roadmap

- September 2018: Food Network + Seed corn study: £6k
 - Theoretical feasibility study
- March 2019: SFN+ extension: £5k
 - Refinement to feasibility study
- June 2019: STFC Proof-of-Concept study: £40
 - Select an implementation scenario and design the instrument breadboard
- 2020: STFC Challenge Led Applied Systems Programme (CLASP); Security and Environment: Bidding for £250k
 - Proposal to build an instrument prototype and perform laboratory- and field campaigns
